The soft-clipped-A end type (1Sa) is enriched on the uncapped mitochondrial genome

At YIA starts, 1Sa is 8.42% of chrM reads against 0.60% of nuclear reads (×14). Candidate explanation: NAD caps, which yeast mtRNAP adds at its promoter starts.

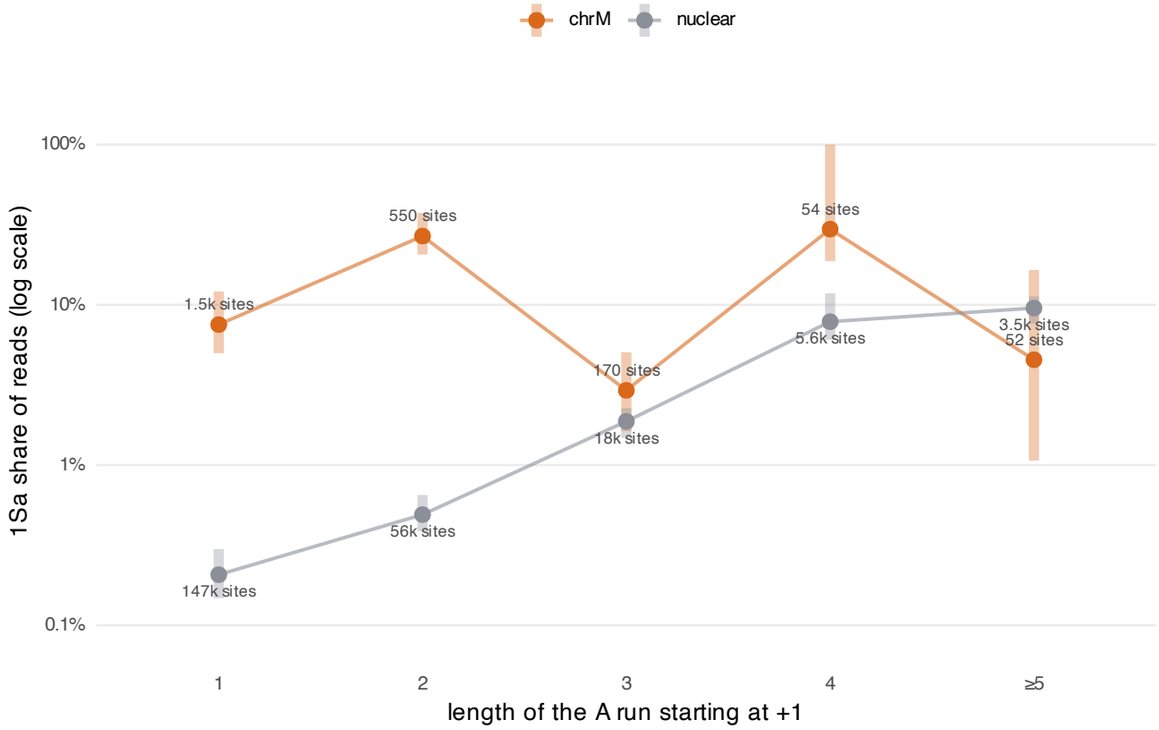

A End-type composition, nuclear vs mitochondrial

Pooled over 7 CAGE libraries; right column is chrM / nuclear.

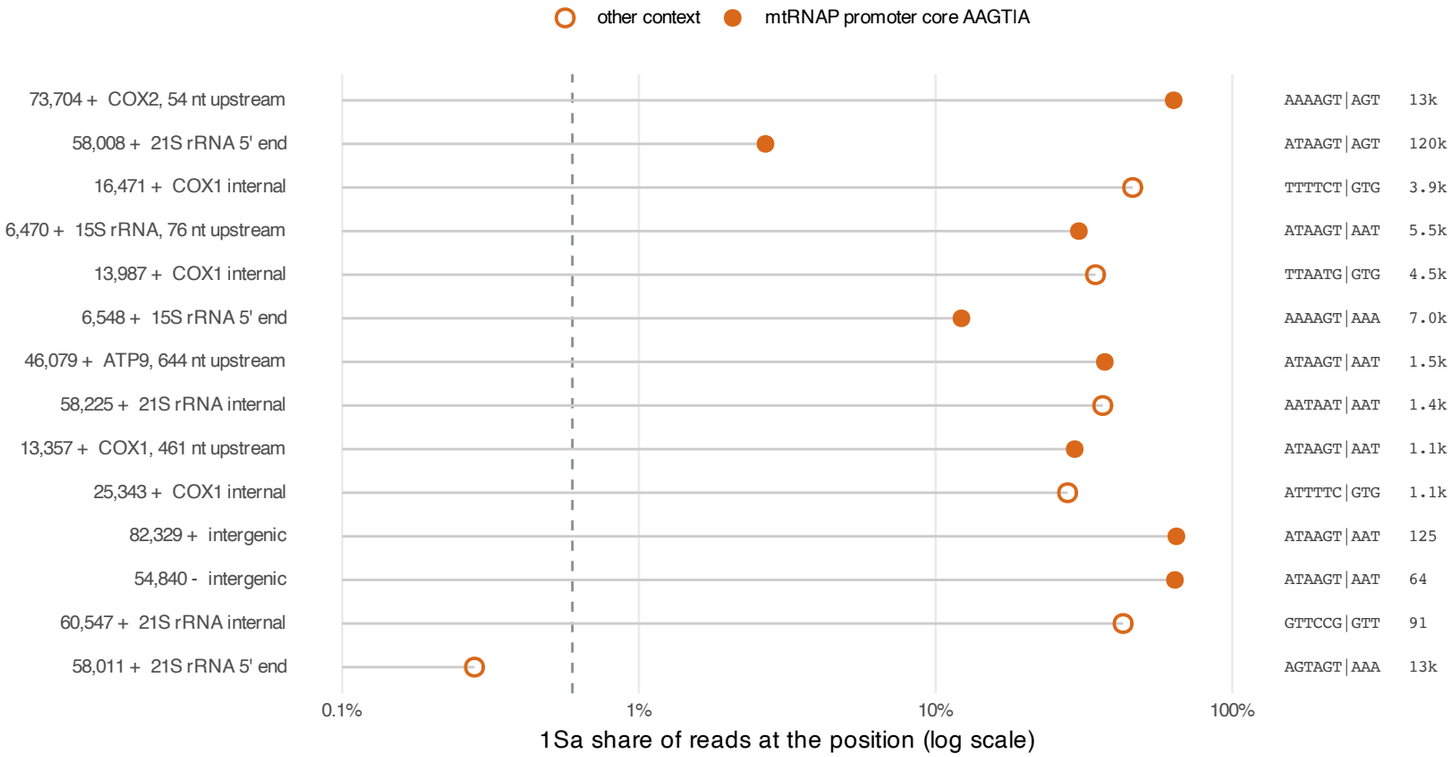

B 1Sa at YIA starts, stratified by A-run length

Dot: pooled share. Bar: range over libraries. Nuclear signal tracks A runs; chrM does not.

C chrM positions with ≥ 30 1Sa reads

Dashed: nuclear YIA baseline (0.60%). Right: sequence -6..-1 | +1..+3 and total depth.

D Sequence around +1 of single-A-clip-rich positions
